

5. The Essential Theory of Consciousness and Grand Unification: It has been stated in the Upanishats that there is an inner controller within each and every system within the Universe. For example, the inner controller moves within the air, and has the body of the air and yet the air has no knowledge of it. Statements such as these have helped Aniruddha to locate the inner controller. Through this scientific analysis, he has calculated the frequencies of these inner controllers within various material systems. The frequencies of the waves of the inner controller (called essential waves) are in the range 10^0 Hz to 10^{-16} Hz. This has essentially given a clue to Aniruddha that the so-called continuum may be composed of such essential waves extending from 10^0 Hz to $10^{-\infty}$ Hz. These waves spreading lengthwise and crosswise, fill the entire space and make it appear full. When the frequency becomes so very low as $10^{-\infty}$ it appears that the space is at its zero-state vibration. In such a state it can be described as motionless. But when the frequencies get larger and larger, the fabric of the space changes. Also these waves are so very close in their frequencies, they appear as a continuum. Because of this peculiar nature, many seers described this state as a state of no seeds (Nirbjeeja). In modern terminology, it may be called the unquantized space. Yajñavalkya made this space fivefold and gave the names such as Viśvākāśam (The Normal Space), Parākāśam (The Paranormal Space), Mahākāśam (The Great Space), Sooryākāśam (The Solar Space), and Paramākāśam (The Absolute Space). In Tejo Bindu Upanishat, this space is referred to as a continuum of Sacchidananda (Existence, knowledge, and bliss). In Bhagavad Geeta, it is referred to as Omn, Tat, Sat. According to Yajñavalkya, this space is the only knower, only hearer, only thinker, only smeller, and so forth. In Kaivalya Upanishat, it has been described as the Isolated Brahman. In its state of isolation, although it has the faculty of knowing, there is no other thing for it to know about. Only when there are two, then the aspects of hearing, touching, smelling, and others arise. This isolated Brahman has all the faculties of hearing, touching, smelling, and so forth, but in the absence of the second entity, these faculties become latent in the isolated Brahman. Tat is fullness but without the grandeur of sensations. Avadhoota described it as the essence of immortal knowledge (Jñānāṁpta saram). Although capable of cognition, it appears as though it is without cognition. But since it acquires consciousness when there is a second entity, Mandookyayana described it as neither conscious nor unconscious. Since this is described as Fullness, this is the resultant of all the forces of nature projected from it alone. Entry into this state of isolation is referred to as Mahā Yoga (Attainment of Grand Unification). Bhagavad Geeta describes such a person as Purushottama (The Supreme Person), Aksharam (The Imperishable) and so forth. Some people have used terms such as Tatastha (The Indifferent), Sakshi (The Witness), Upadrashtaram (The Overseer), etc. to describe this Isolated Brahman. Since it exhibits no properties such as light, sound, fire, etc. it has been described as Nirguna (Without Attributes). It is the Yajñōvaśiṣṭam, what is leftover after the sacrifice. It is the leftover when everything else is denied using the Nety Nety (Not This Not This) concept of Yajñavalkyah. Ribhuh calls this Brahman Nishpratiyogika Brahman (The Indeterminate Brahman.) Although no seeds are apparently present in it, it is not entirely wrong to identify this as the causal body (Kāraṇa Śāreera) since this has been described as the origin, sustenance, and

dissoloution of the Universe. In Bhagavad Geeta, it is described as the unknown but when it glows on its own accord, all other luminaries shine along with it.

The point where the frequency becomes 10^0 Hz onwards up to about 10^{23} Hz, it forms the normal light divided as the infrared, the visible, and the ultraviolet. In the Brahma Upanishads, they place five Brahman in it, namely, Sadyo Jātam, Vāmadevam, Aghoram, Tat Purusha, and Eeśāna. It is also customary to describe this light as Brahmaa, Vishnu, and Śiva. It is from Sadyo Jātam the Earth is born. Eeśāna is common to both the hidden and the known light. While Eeśāna is the Lord and the Creator of the Unmanifest, Vishnu is the sustainer, and Brahmaa is the creator of the Manifest. The Manifest contains the five great elements, the mind, intellect, and ego. The Manifest is also described as the Fullness since it contains the supreme as its essence. If we look at the Manifest through a lens, the result is the essence of the Fullness. The normal light acts as a bridge between the Supreme and the Lower Manifest.
